The output signals shall be continuously monitored during vibration along each of the three axes. Any output voltage change greater than ±100 mv from the initial amplitude shall be cause for rejection. The output monitoring equipment shall measure out-of-tolerance conditions that exist for a period greater than 1 msec.

4.2.2 Nonconforming Units. Failure of the units to pass any examination or test of this specification shall automatically classify the unit as nonconforming. Each nonconforming unit corrected by the contractor shall be reinspected. Reinspection may be limited to the test or examination which defined the nonconformance, or, when directed by the cognizant inspector, a complete retest and reexamination may be required. Nonconforming units which have not been corrected will be considered for acceptance only upon formal application by the contractor to the cognizant NASA representative.

4.3 TESTS

4.3.1 Drawing Compliance. The assembly shall be visually examined for compliance to the requirements of Drawing 6007010. Particular attention shall be given to inspection for nicks, scratches, burrs, dents, encapsulant defects, contaminants, pin misalignment, and legibility and appearance of markings.

4.3.2 Workmanship-Vibration. The assembly shall be mounted to the vibration fixture in a manner similar to the way it will be mounted in service. The assembly shall be vibrated along the horizontal, vertical and lateral axis (see Figure 2) with simple harmonic motion swept from 10 to 2000 cps at a rate of 1 octave/15 sec. The magnitude of vibration shall be 3.5g rms limited to a 0.4 inch pp constant displacement from 10 cps to the crossover frequency.

a. The continuity of the assembly shall be continuously monitored during vibration at the pins specified in Table VI. Any evidence of discontinuity shall be cause for rejection. The continuity monitoring circuitry shall have a response time equal to or less than 10 μsec in detecting any open circuit.

b. Prior to vibration along each of the three axes, the input signals shall be adjusted within the range specified in Table I to obtain the outputs specified therein, except for assembly sections C5 and D9 which shall be set to input conditions, except that the input required to establish the output specified for assembly sections D1, D2, and D3 shall be used to establish the output for assembly sections A1, A2, and A3. The output signals shall be continuously monitored during vibration along each of the three axes. Any output voltage change greater than ±100 mv from the initial amplitude shall be cause for rejection. The output monitoring equipment shall measure out-of-tolerance conditions that exist for a period greater than 1 msec.

At the conclusion of the 4-hour period, the input voltages shall be readjusted to the values recorded in 4.3.3.a and the output voltages shall be within ±4 percent of the value recorded in 4.3.3.a. The new values of input and output voltages shall be recorded.

4.3.4 Continuity and DC Resistance. The resistance between the pins specified in Table II shall be measured with a low voltage resistance measuring device in accordance with Method 303 of MIL-STD-202.

4.3.5 Insulation Resistance. The resistance from each connector pin except those pins specified in Table III, to the assembly frame shall be measured in accordance with Method 302 of MIL-STD-202 using a megohmmeter having an output voltage of 225±75 vdc and limited to a short circuit current of 6.0 μa. The resistance shall be greater than or equal to 100 megohms.

4.3.6 Offset Voltage. With each input Hi pin specified in Table I connected to its respective input Lo pin, the dc voltage appearing across the output pins specified in Table I shall be as specified therein, except for assembly section E5 which shall have a 110.00±0.10 vdc input.

4.3.7 Scale Factor. The input signals shall be adjusted within the range specified in Table I to obtain the outputs specified therein and the input and output voltages recorded.

4.3.8 Output Ripple and Noise. The input signal voltages shall be adjusted within the range specified in Table I to obtain the outputs specified in Table I, and the peak-to-peak ripple voltage or noise appearing at the corresponding output pins measured and recorded. The ripple voltage or noise appearing at the output pins shall be less than or equal to the value specified in Table I. (See Figure 3.)

4.3.9 PIPA Sensor Output. With a sensor input resistance of 1594.5±3.0 ohms connected across 30J1-C19 (Hi) and 30J1-F14 (Lo) and 30J1-C20 (Lo), the output voltage shall be 5.000±0.005 vdc.

4.3.10 IRIG Sensor Output. With a sensor resistance of 2037.0±30.0 ohms connected across 30J1-B19 (Hi) and 30J1-F14 (Lo) and 30 J1-B20 (Lo), the output voltage shall be 5.000±0.005 vdc.

4.3.11 PIPA Thermistor Output. With a sensor input resistance of 1279.5±12.8 ohms connected across 30J1-C32 and 30J1-D32, the output voltage shall be 2.500±0.250 vdc.

4.3.12 Weight. The assembly shall be weighed to the nearest 0.01 pound.

4.2.1.3 Test Setup. Unless otherwise specified the operating voltages of Table IV shall be applied to the assembly. Each pair of output pins for each assembly section, except assembly sections C7 and F5, shall have a 1 megohm ±1 percent resistor connected between them during vibration and temperature tests and only during monitoring on other tests. Assembly sections C7 and F5 shall have a 500K ohm ±5 percent resistor connected between its output pins during vibration and temperature tests and only during monitoring on other tests.

4.2.2 Nonconforming Units. Failure of the units to pass any examination or test of this specification shall automatically classify the unit as nonconforming. Each nonconforming unit corrected by the contractor shall be reinspected. Reinspection may be limited to the test or examination which defined the nonconformance, or, when directed by the cognizant inspector, a complete retest and reexamination may be required. Nonconforming units which have not been corrected will be considered for acceptance only upon formal application by the contractor to the cognizant NASA representative.

4.3 TESTS

4.3.1 Drawing Compliance. The assembly shall be visually examined for compliance to the requirements of Drawing 6007010. Particular attention shall be given to inspection for nicks, scratches, burrs, dents, encapsulant defects, contaminants, pin misalignment, and legibility and appearance of markings.

4.3.2 Workmanship-Vibration. The assembly shall be mounted to the vibration fixture in a manner similar to the way it will be mounted in service. The assembly shall be vibrated along the horizontal, vertical and lateral axis (see Figure 2) with simple harmonic motion swept from 10 to 2000 cps at a rate of 1 octave/15 sec. The magnitude of vibration shall be 3.5g rms limited to a 0.4 inch pp constant displacement from 10 cps to the crossover frequency.

a. The continuity of the assembly shall be continuously monitored during vibration at the pins specified in Table VI. Any evidence of discontinuity shall be cause for rejection. The continuity monitoring circuitry shall have a response time equal to or less than 10 μsec in detecting any open circuit.

b. Prior to vibration along each of the three axes, the input signals shall be adjusted within the range specified in Table I ±12-1/2% from nominal to obtain the outputs specified therein, except for assembly Sections C5 and D9, which shall be set to input conditions, except that the input required to establish the output specified for assembly Sections D1, D2 and D3 shall be used to establish the output for assembly Sections A1, A2 and A3. The output signals shall be continuously monitored during vibration along each of the three axes. Any output voltage change greater than ±100 mv from the initial amplitude shall be cause for rejection. The output monitoring equipment shall measure out-of-tolerance conditions that exist for a period greater than 1 msec.

c. The pins specified in Table V shall be continuously monitored during vibration for discontinuity and circuit isolation. The monitoring circuitry shall have a response time equal to or less than 10 μsec in detecting any discontinuity and/or short circuit.

4.3.3 Temperature Test. The temperature test shall be as follows:

APPROVALS	A. C. METZGER NASA/MSC	R M Kowalski 7 June 66	6-14-66 MIT/IL	G H Krier ACSP

d. The offset voltage at the output terminals measured with the respective input Hi and Lo pins connected together as shown in Figure 1 with S1 in position A.

e. The offset voltage algebraically subtracted from the six output measurements.

f. The outputs of $1.000E_s$ divided by 5, those at $0.600E_s$ by 3, and those at $0.200E_s$ by 1.000.

g. The six calculated values averaged and the deviation of each value from the average determined.

4.3.12 Output Impedance. With the input voltage to assembly sections a, b, and c adjusted for respective outputs of +2.500±0.005 vdc and then a 100k ohm ±1 percent resistor substituted for the 1 megohm load resistor, the output voltage for assembly sections a, b, and c shall not decrease more than 120 mv.

4.3.13 Output Ripple and Noise. With the output of assembly sections a, b, c, and e adjusted to 2.50±0.10 vdc, the ripple and noise voltage at the respective output pins shall be <100 mv pp for assembly sections a, b, c, and <50 mv pp for assembly section e.

5. PREPARATION FOR DELIVERY

5.1 GENERAL. Preparation for delivery shall be in accordance with Specification ND1002214.

4.2.1.3 Test Connections. Unless otherwise specified, the tests specified herein shall be performed on each assembly section as shown in Figure 1, using the applicable input and output pins as detailed in Table III.

TABLE III

INPUT-OUTPUT PIN CONNECTIONS

ASSEMBLY SECTION	INPUT PINS		OUTPUT PINS	
	Hi	Lo	Hi	Lo
a	3	8	4	13
b	6	8	7	13
c	14	8	12	13
d	11	15	11	22
e	18	19 & 20	21	22

4.2.2 Nonconforming Units. Failure of the units to pass any examination or test of this specification shall automatically reclassify the unit as nonconforming. Each nonconforming unit corrected by the contractor shall be reinspected. Reinspection may be limited to the test or examination which defined the nonconformance, or, when directed by the cognizant inspector, a complete retest and re-examination may be required. Nonconforming units which have not been corrected will be considered for acceptance only upon formal application by the contractor to the cognizant NASA representative.

4.3 TESTS

4.3.1 Drawing Compliance. The assembly shall be visually examined for compliance to the requirements of Drawing 6007011. Particular attention shall be given to inspection for nicks, scratches, burrs, dents, encapsulant defects, contaminants, pin misalignment, and legibility and appearance of markings.

4.3.2 Workmanship-Vibration. The assembly shall be vibrated with the input test voltage, and output loads and voltages connected and monitored as shown in Figure 1. The assembly shall be mounted in the vibration fixture in a manner similar to the way it will be mounted in service so that it will be vibrated along the axes shown in Figure 2. The assembly shall be vibrated with simple harmonic motion swept from 10 to 2000 cps at a rate of one octave/15 sec. The magnitude of vibration shall be 6.0g rms limited to a 0.4 inch pp constant displacement from 10 cps to the crossover frequency. Previbration output levels shall be set within the range of 2.00±0.60 vdc for assembly sections a, b, c, d and e. During vibration the output voltages shall not deviate by more than ±10 percent of the previbration levels for a period exceeding 1 msec. Any deviation exceeding these requirements shall be cause for rejection of the assembly. After vibration, the assembly shall be examined as specified in 4.3.1.

4.3.3 Insulation Resistance. The dc resistance between all assembly pins and pin 1 shall be measured in accordance with Method 302 of MIL-STD-202 using a megohmmeter having an output voltage of 225±75 vdc and limited to a short circuit current of 6.0 microamperes. The insulation resistance shall be $\geq$100 megohms.

3.1.8 Output Ripple and Noise. The output ripple and noise of assembly sections a, b, c, d, and e, shall be less than 10 mv pp for a respective output of +2.500±0.050 vdc.

3.2 PRODUCT CONFIGURATION

3.2.1 Drawings. The configuration of the assembly shall be in accordance with Drawing 6007012 and all drawings and engineering data referenced thereon.

3.2.2 Standards of Manufacturing, Manufacturing Process, and Production

3.2.2.1 Insulation Resistance. The dc resistance between all assembly pins and pin 1 shall be ≥100 megohms.

3.2.2.2 Continuity and DC Resistance. The continuity and dc resistance shall be as specified in Table I.

4.3.3 Insulation Resistance. Using test equipment with a test potential of 500 vdc limited to a short circuit current of 6 u amps measure the resistance between pin 1 (Chassis ground) and all other assembly pins connected together. Verify that the insulation resistance is as specified in paragraph 3.2.2.1.

4.3.4 Continuity and DC Resistance. The dc resistance between the pins listed in Table I shall be as specified when measured with a low-voltage, resistance measuring device using Method 303 of Standard MIL-STD-202. To assure a good electrical connection when measuring between pin 1 and the chassis, the anodizing may be penetrated on the top of the module.

4.3.5 Circuit Isolation. Verification records shall be examined to verify that the requirement of 3.2.2.2. has been met.

4.3.6 DC Current Drain. With all the input pins specified in Table II connected together and the reference voltage off, the dc current drain on the 28.0 vdc supply shall be 15.0 ±5.0 ma.

4.3.7 Reference Current Drain. With all of the input pins specified in Table II connected together and the dc supply voltage applied, the current drain on the 28V rms, 800 cps reference supply shall be less than 80.0 ma.

4.3.8 Offset Voltage. With the pins of assembly sections a, b, c, and d specified in Table II connected together and the operating voltages applied, the voltage at each pair of respective output pins shall be ≤10mv dc. With an input voltage of 110.00±0.10 vdc applied to the input pins of assembly section e, as specified in Table II, the voltage at the respective output pins shall be less than 250 mvdc.

4.3.9 Scale Factor. With the outputs of assembly sections a, b, c, and d adjusted to 2.500±0.005 vdc, plus the measured offset voltage, the signal voltage at each corresponding set of input pins shall be between 19.75 and 23.25V rms with a phase angle of +5°±2°. With the output of assembly section e adjusted to -2.500±0.005 vdc, the input voltage shall be between 80.00 and 90.00 vdc. With the output of assembly section e adjusted to +2.500±0.005 vdc, the input voltage shall be between 130.0 and 140.0 vdc. With a 1 Megohm load across the output of assembly section f, the output voltage shall be a 800 pps square wave with a minimum amplitude of 25.0V pp. With a 2K ohm load across the output of assembly section f, the output voltage shall be ≥22.0V pp.

4.3.10 Gain Stability. With the inputs to assembly sections a, b, c, d, and e, adjusted for corresponding outputs of +2.500±0.005vdc, enhancing or degrading the +28 vdc supply shall not cause the outputs of a, b, c, and d to deviate by more than ±25 mvdc and section c shall not deviate by more than ±75 mvdc. Degrading the +28 vdc supply shall not cause the 800 pps square wave output of assembly section f to decrease below 18V pp with a 2KΩ ± 2 percent load.

4.3.11 Scale Factor Linearity.

4.3.11.1 Assembly sections a, b, c, and d. With the conditions specified below established for assembly sections a, b, c, and d, each of six calculated scale factor values shall not deviate from the average of the six values by more than ±4 percent.

4.3.13 Diode Function. With the output of assembly section e adjusted for +2.50±0.10 vdc, the output voltage shall remain constant when pins 31 and 8 are momentarily connected together. With the output of assembly section e adjusted to -2.500±0.010 vdc, repeating the above test shall cause the output to decrease below -1.0 vdc.

4.3.14 Output Ripple and Noise. With the output of assembly sections a, b, c, d, and e at 2.50±0.05 vdc, the ripple and noise voltage at the respective output pins shall be <10 mv pp.

4.2.2 Nonconforming Units. Failure of the units to pass any examination or test of this specification shall automatically classify the unit as nonconforming. Each nonconforming unit corrected by the contractor shall be reinspected. Reinspection may be limited to the test or examination which defined the nonconformance, or, when directed by the cognizant inspector, a complete retest and reexamination may be required. Nonconforming units which have not been corrected will be considered for acceptance only upon formal application by the contractor to the cognizant NASA representative.

4.3 TESTS

4.3.1 Drawing Compliance. The assembly shall be visually examined for compliance to the requirements of Drawing 6007012. Particular attention shall be given to inspection for nicks, scratches, burrs, dents, encapsulant defects, contaminants, pin misalignment, and legibility and appearance of markings.

4.3.2 Workmanship-Vibration. The assembly shall be vibrated with the input test voltage, and output loads and voltages connected and monitored as shown in Figure 1. The assembly shall be mounted in the vibration fixture in a manner similar to the way it will be mounted in service so that it will be vibrated along the axes shown in Figure 2. The assembly shall be vibrated with simple harmonic motion swept from 10 to 2000 cps at a rate of one octave/15 sec. The magnitude of vibration shall be 6.0g rms limited to a 0.4 inch pp constant displacement from 10 cps to the crossover frequency. Previbration output levels shall be set within the range of 2.00±0.60 vdc for assembly sections a, b, c, d, and e. A 24.0±4.0V pp, 800 pps, square wave shall be present at the output pins of assembly section f. During vibration the output voltages shall not deviate by more than ±10 percent of the previbration levels for a period greater than 1 msec. Any deviation exceeding this requirement shall be cause for rejection of the assembly. After vibration, the assembly shall be examined as specified in 4.3.1.

4.3.3 Insulation Resistance. Using test equipment with a test potential of 500 vdc limited to a short circuit current of 6 u amps measure the resistance between pin 1 (Chassis ground) and all other assembly pins connected together. Verify that the insulation resistance is as specified in paragraph 3.2.2.1.

4.3.4 Continuity and DC Resistance. The dc resistance between the pins listed in Table I shall be as specified when measured with a low-voltage, resistance measuring device using Method 303 of Standard MIL-STD-202. To assure a good electrical connection when measuring between pin 1 and the chassis, the anodizing may be penetrated on the top of the module.

4.3.5 Circuit Isolation. Verification records shall be examined to verify that the requirement of 3.2.2.2. has been met.

4.3.6 DC Current Drain. With all the input pins specified in Table II connected together and the reference voltage off, the dc current drain on the 28.0 vdc supply shall be 15.0 ±5.0 ma.

4.3.7 Reference Current Drain. With all of the input pins specified in Table II connected together and the dc supply voltage applied, the current drain on the 28V rms, 800 cps reference supply shall be less than 30.0 ma.

4.3.8 Offset Voltage. With the pins of assembly sections a, b, c, and d specified in Table II connected together and the operating voltages applied, the voltage at each pair of respective output pins shall be ≤10mv dc. With an input voltage of 110.00±0.10 vdc applied to the input pins of assembly section e, as specified in Table II, the voltage at the respective output pins shall be less than 250 mvdc..

4.3.9 Scale Factor. With the outputs of assembly sections a, b, c, and d adjusted to 2.500±0.005 vdc, plus the measured offset voltage, the signal voltage at each corresponding set of input pins shall be between 19.35 and 23.65V rms with a phase angle of +5°±2°. With the output of assembly section e adjusted to -2.500±0.005 vdc, the input voltage shall be between 80.00 and 90.00 vdc. With the output of assembly section e adjusted to +2.500±0.005 vdc, the input voltage shall be between 130.0 and 140.0 vdc. With a 1 Megohm load across the output of assembly section f, the output voltage shall be a 800 pps square wave with a minimum amplitude of 25.0V pp. With a 2K ohm load across the output of assembly section f, the output voltage shall be ≥22.0V pp.

4.3.10 Gain Stability. With the inputs to assembly sections a, b, c, d, and e, adjusted for corresponding outputs of +2.500±0.005vdc, enhancing or degrading the +28 vdc supply shall not cause the outputs of a, b, c, and d to deviate by more than ±25 mvdc and section c shall not deviate by more than ±75 mvdc. Degrading the +28 vdc supply shall not cause the 800 pps square wave output of assembly section f to decrease below 18V pp with a 2KΩ±2 percent load.

4.3.11 Scale Factor Linearity.

4.3.11.1 Assembly sections a, b, c, and d. With the conditions specified below established for assembly sections a, b, c, and d, each of six calculated scale factor values shall not deviate from the average of the six values by more than ±4 percent.

Each nonconforming unit corrected by the contractor shall be reinspected. Reinspection may be limited to the test or examination which defined the nonconformance, or, when directed by the cognizant inspector, a complete retest and reexamination may be required. Nonconforming units which have not been corrected will be considered for acceptance only upon formal application by the contractor to the cognizant NASA representative.

4.3 TESTS

4.3.1 **Drawing Compliance.** The assembly shall be visually examined for compliance to the requirements of Drawing 6007012. Particular attention shall be given to inspection for nicks, scratches, burrs, dents, encapsulant defects, contaminants, pin misalignment, and legibility and appearance of markings.

4.3.2 **Workmanship-Vibration.** The assembly shall be vibrated with the input test voltage, and output loads and voltages connected and monitored as shown in Figure 1. The assembly shall be mounted in the vibration fixture in a manner similar to the way it will be mounted in service so that it will be vibrated along the axes shown in Figure 2. The assembly shall be vibrated with simple harmonic motion swept from 10 to 2000 cps at a rate of one octave/15 sec. The magnitude of vibration shall be 6.0g rms limited to a 0.4 inch pp constant displacement from 10 cps to the crossover frequency. Previbration output levels shall be set within the range of 2.50±0.10 vdc for assembly sections a, b, c, d, and e. A 24.0±4.0V pp, 800 pps, square wave shall be present at the output pins of assembly section f. During vibration the output voltages shall not deviate by more than ±10 percent of the previbration levels for a period greater than 1 msec. Any deviation exceeding this requirement shall be cause for rejection of the assembly. After vibration, the assembly shall be examined as specified in 4.3.1.

4.3.3 Insulation Resistance. Using test equipment with a test potential of 500 vdc limited to a short circuit current of 6 u amps measure the resistance between pin 1 (Chassis ground) and all other assembly pins connected together. Verify that the insulation resistance is as specified in paragraph 3.2.2.1.

4.3.4 Continuity and DC Resistance. The dc resistance between the pins listed in Table I shall be as specified when measured with a low-voltage, resistance measuring device using Method 303 of Standard MIL-STD-202. To assure a good electrical connection when measuring between pin 1 and the chassis, the anodizing may be penetrated on the top of the module.

4.3.5 Circuit Isolation. Verification records shall be examined to verify that the requirement of 3.2.2.2. has been met.

4.3.6 DC Current Drain. With all the input pins specified in Table II connected together and the reference voltage off, the dc current drain on the 28.0 vdc supply shall be 18.0±1.8 ma.

4.3.7 Reference Current Drain. With all of the input pins specified in Table II connected together and the dc supply voltage applied, the current drain on the 28V rms, 800 cps square wave reference supply shall be less than 23.0 ma.

4.3.8 Offset Voltage. With the pins of assembly sections a, b, c, and d specified in Table II connected together and the operating voltages applied, the voltage at each pair of respective output pins shall be ≤10mv dc. With an input voltage of 110.00±0.10 vdc applied to the input pins of assembly section e, as specified in Table II, the voltage at the respective output pins shall be less than 100 mvdc.

4.3.9 Scale Factor. With the outputs of assembly sections a, b, c, and d adjusted to 2.500±0.005 vdc, plus the measured offset voltage, the signal voltage at each corresponding set of input pins shall be between 19.75 and 23.25V rms with a phase angle of +5°±2°. With the output of assembly section e adjusted to -2.500±0.005 vdc, the input voltage shall be between 76.50 and 93.50 vdc. With the output of assembly section e adjusted to +2.500±0.005 vdc, the input voltage shall be between 121.50 and 148.50 vdc. With a 1 Megohm load across the output of assembly section f, the output voltage shall be a 800 pps square wave with a minimum amplitude of 25.0V pp. With a 2K ohm load across the output of assembly section f, the output voltage shall be ≥22.0V pp.

4.3.10 Gain Stability. With the inputs to assembly sections a, b, c, d, and e, adjusted for corresponding outputs of +2.500±0.005vdc, enhancing or degrading the +28 vdc supply shall not cause the output to deviate by more than ±25 mvdc. Degrading the +28 vdc supply shall not cause the 800 pps square wave output of assembly section f to decrease below 18V pp.

4.3.11 Scale Factor Linearity.

e. Each normalized output shall not deviate by more than 4 percent from the average obtained in c.

4.3.12 Output Impedance. With the operating voltages applied the input to assembly sections, a, b, c, d, and e, adjusted for an output of 2.500±0.005 vdc for the respective assembly section, and then a 100K ohm ±1 percent resistor substituted for the 1-megohm load resistor, the respective assembly section output shall not drop below 2.380 vdc.

4.3.13 Diode Function. With the output of assembly sections a, b, c, d, and e adjusted for +2.50±0.10 vdc, the output voltage shall remain constant for sections a, b, c, and d when pins 14 and 26 are momentarily connected together. The output voltage of assembly section e shall remain constant when pins 31 and 8 are momentarily connected together. With the output of all the assembly sections adjusted to -2.500±0.010 vdc, repeating the above tests shall cause the respective assembly outputs to decrease below -1.0 vdc.

4.3.14 Output Ripple and Noise. With the output of assembly sections a, b, c, d, and e at 2.50±0.05 vdc, the ripple and noise voltage at the respective output pins shall be <10 mv pp.

5. PREPARATION FOR DELIVERY

b. Prior to vibration along each of the three axes, the input signals shall be adjusted within the range specified in Table I to obtain the outputs specified therein, except for assembly Section C5 which shall be set to input conditions. The output signals shall be continuously monitored during vibration along each of the three axes. Any output voltage change greater than ±100 mv from the initial amplitude shall be cause for rejection. The output monitoring equipment shall measure out-of-tolerance conditions that exist for a period greater than 1 msec.

c. The pins specified in Table VI shall be continuously monitored during vibration for discontinuity and current isolation. The monitoring circuitry shall have a response time equal to or less than 10 usec in detecting any discontinuity and/or short circuit.

4.3.3 **Temperature Test.** The temperature test shall be as follows:

a. The input signals shall be adjusted within the range specified in Table I to obtain the outputs specified therein, except for assembly Sections G5 which shall be set to input conditions. The input and output voltage shall then be measured and recorded.

b. The assembly shall then be soaked at 49° ±3°C for 4 hours. At the conclusion of the 4-hour period, the input voltages shall be readjusted to the values recorded in 4.3.3.a and the output voltages shall be within ±4 percent of the value recorded in 4.3.3.a. The new values of input and output voltages shall be recorded.

Each nonconforming unit corrected by the contractor shall be reinspected. Reinspection may be limited to the test or examination which defined the nonconformance, or, when directed by the cognizant inspector, a complete retest and reexamination may be required. Nonconforming units which have not been corrected will be considered for acceptance only upon formal application by the contractor to the cognizant NASA representative.

4.3 TESTS

4.3.1 **Drawing Compliance.** The assembly shall be visually examined for compliance to the requirements of Drawing 6007013. Particular attention shall be given to inspection for nicks, scratches, burrs, dents, contaminants, pin misalignment, and legibility and appearance of marking.

4.3.2 **Workmanship-Vibration.** The assembly shall be mounted to the vibration fixture in a manner similar to the way it will be mounted in service. The assembly shall be vibrated along the horizontal, vertical and lateral axis (see Figure 2) with simple harmonic motion swept from 10 to 2000 cps at a rate of 1 octave/15 sec. The magnitude of vibration shall be 3.5g rms limited to a 0.4 inch pp constant displacement from 10 cps to the crossover frequency.

a. The continuity of the assembly shall be continuously monitored during vibration at the pins specified in Table V. Any evidence of discontinuity shall be cause for rejection. The continuity monitoring circuitry shall have a response time equal to or less than 10 μsec in detecting any open circuit.

b. Prior to vibration along each of the three axes, the input signals shall be adjusted within the range specified in Table I to obtain the output specified therein. The output signals shall be continuously monitored during vibration along each of the three axes. Any output voltage change greater than ±100 mv from the initial amplitude shall be cause for rejection. The output monitoring equipment shall measure out-of-tolerance conditions that exist for a period greater than 1 msec.

c. The pins specified in Table VI shall be continuously monitored during vibration for discontinuity and current isolation. The monitoring circuitry shall have a response time equal to or less than 10 usec in detecting any discontinuity and/or short circuit.

4.3.3 Temperature Test. The temperature test shall be as follows:

a. The input signals shall be adjusted within the range specified in Table I to obtain the outputs specified therein. The input and output voltages shall then be measured and recorded.

b. The assembly shall then be soaked at 49° ±3°C for 4 hours. At the conclusion of the 4-hour period, the input voltages shall be readjusted to the values recorded in 4.3.3.a and the output voltages shall be within ±4 percent of the value recorded in 4.3.3.a. The new values of input and output voltages shall be recorded.

4.3.4 Continuity and DC Resistance. The resistance between the pins specified in Table II shall be measured with a low voltage resistance measuring device in accordance with Method 303 of MIL-STD-202.

4.3.5 Insulation Resistance. The resistance from each connecter pin except those pins specified in Table III, to the assembly frame shall be measured in accordance with Method 302 of MIL-STD-202 using a megohmmeter having an output voltage of 225±75 vdc and limited to a short circuit current of 6.0 μa. The resistance shall be greater than or equal to 100 megohms.

4.3.6 Offset Voltage. With each input Hi pin specified in Table I connected to its respective input Lo pin, the dc voltage appearing across the output pins specified in Table I shall be as specified therein, except for assembly section D5 which shall have a 110.0±0.10 vdc input.

4.3.7 Scale Factor. The input signals shall be adjusted within the range specified in Table I to obtain the outputs specified therein and the input and output voltages recorded.

4.3.8 Output Ripple and Noise. The input signal voltages shall be adjusted within the range specified in Table I to obtain the outputs specified in Table I, and the peak-to-peak ripple voltage or noise appearing at the corresponding output pins measured and recorded. The ripple voltage or noise appearing at the output pins shall be less than or equal to the value specified in Table I. (See Figure 3.)

4.3.9 PIPA Sensor Output. With a sensor input resistance of 1594.5±3 ohms connected across 30J1-C19 (Hi) and 30J1-F14 (Lo), 30J1-C20 (Lo), the output voltage shall be 5.000±0.005 vdc.

4.3.10 Weight. The assembly shall be weighed to the nearest 0.01 pound.

4.3.11 Calibration

4.3.11.1 AC Input Circuits. The following assembly sections shall be calibrated as follows using the pin connections specified in Table I and the test setup shown in Figure 4:

2.2 CONFLICTING REQUIREMENTS. In event of a conflict between requirements, the following order of precedence shall apply. The contractor shall also notify MIT/IL APOLLO Management of the conflict.

a. The contract
b. This specification
c. Documents listed in this section

4. QUALITY ASSURANCE PROVISIONS

4.1 PRODUCT PERFORMANCE AND CONFIGURATION REQUIREMENTS/QUALITY VERIFICATION CROSS REFERENCE INDEX.

Test/Examination	Requirement	Method
Continuity and DC Resistance	3.1.1	4.3.3
Grounding Pin Resistance	3.1.2	4.3.4
Insulation Resistance	3.1.3	4.3.5
Mounting Screw Insert Resistance	3.1.4	4.3.6
Drawing Compliance	3.2.1	4.3.1

4.2 GENERAL. The contractor responsible for the manufacture of the assembly shall be responsible for the accomplishment of each test required herein.

4.2.1 Test Conditions

4.2.1.1 Environmental. Unless otherwise specified, the assemblies shall be tested under the following ambient conditions:

a. Temperature: 25° ±10°C
b. Relative Humidity: 90% max
c. Barometric Pressure: 28 to 32 inches of Hg

4.2.2 Nonconforming Units. Failure of the unit to pass any examination or test of this specification shall automatically classify the unit as nonconforming. Each nonconforming unit corrected by the contractor shall be reinspected. Reinspection may be limited to the test or examination which defined the nonconformance, or, when directed by the cognizant inspector, a complete retest and reexamination may be required. Nonconforming units which have not been corrected will be considered for acceptance only upon formal application by the contractor to the cognizant NASA representative.

4.3 TESTS

4.3.1 Drawing Compliance. The assembly shall be visually examined for compliance to the requirements of Drawing 6007014. Particular attention shall be given to inspection for nicks, scratches, burrs, dents, encapsulant defects, contaminants, pin misalignment, and legibility and appearance of markings.

4.3.2 Workmanship-Vibration. For spare units only, the assembly shall be vibrated with dummy modules which simulate the respective module weight. The proper connector pins shall be wired and monitored for continuity during the vibration test. The assembly shall be mounted on the vibration fixture in a manner similar to the way it will be mounted in service so that it will be vibrated along the simulated command module X, Y, and Z axes. The assembly shall be vibrated with simple harmonic motion swept from 10 to 2000 cps at a rate of one octave/15 sec. The magnitude of vibration shall be 3.5g rms limited to a 0.3 inch pp

constant displacement from 10 cps to the crossover frequency. During vibration the continuity of the assembly shall be constantly monitored per Drawing 6014550. Any evidence of discontinuity shall be recorded and shall be cause for rejection. The monitoring circuitry shall have a response time of 10 µsec or less for any open circuit. Workmanship-vibration testing shall be performed on all units other than spares at the higher assembly level with operational modules installed.

4.3.3 Continuity and DC Resistance. Continuity and dc resistance shall be measured using a low voltage resistance measuring device in accordance with Method 303 of MIL-STD-202. Measurements shall be made from each individual pin to all other pins electrically connected, but duplicate tests of pins previously tested need not be made. All readings for pins electrically connected per Drawing 6014550 shall be less than 0.5 ohm, with the exception of those pins in Table I. Any readings greater than 0.5 ohm for pins electrically connected as per Drawing 6014550 shall be recorded and shall be cause for rejection. The dc resistance measured between pins listed in Table I shall be as indicated in Table I.

4.3.4 Grounding Pin Resistance. With a dc current of 3.0±2.5 amperes passed through the frame and the pin being tested, and the dc voltage measured across the pin and the frame as shown in Figure 1, the dc resistance between each individual pin listed in Table II and the frame shall be calculated and recorded. The resistance shall be calculated using the equation specified in 6.1 and the value shall be as specified in 3.1.2. To ensure good electrical connections when measuring the voltage and current the protective finish of the frame may be penetrated.

4.3.5 Insulation Resistance. The insulation resistance between each electrically connected network and all other networks shall be as specified in 3.1.3 when measured in accordance with Method 302 of MIL-STD-202. The megohmmeter used shall have an output voltage of 500±100 dc limited to a short circuit current of 2.0 milliamperes or less. Any reading of less than 100 megohms shall be recorded and shall be cause for rejection. Spare pins shall be included as individual networks.

4.3.6 Mounting Screw Insert Resistance. With a dc current of 3.0±2.5 amperes passed through each mounting screw insert as shown in Figure 2, the dc current and voltage drop shall be measured and the mounting screw inset resistance shall be calculated using the formula specified in 6.2.a. To insure a good electrical connection to the header frame, the module guide pins may be used as a connection point. The parallel resistance of all the inserts surrounding each connector shall be calculated using the formula specified in 6.2.b and shall be equal to or less than 10 milliohms.

5. PREPARATION FOR DELIVERY

4. QUALITY ASSURANCE PROVISIONS

4.1 PRODUCT PERFORMANCE AND CONFIGURATION REQUIREMENTS/QUALITY VERIFICATION CROSS REFERENCE INDEX

Test/Examination	Requirement	Method
Continuity and DC Resistance	3.1.1	4.3.3
Grounding Pin Resistance	3.1.2	4.3.4
Insulation Resistance	3.1.3	4.3.5
Mounting Screw Insert Resistance	3.1.4	4.3.6
Drawing Compliance	3.2.1	4.3.1

4.2 GENERAL. The contractor responsible for the manufacture of the assembly shall be responsible for the accomplishment of each test required herein.

4.2.1 Test Conditions

4.2.1.1 Environmental. Unless otherwise specified, the assemblies shall be tested under the following ambient conditions:

a. Temperature: 25° ±10°C
b. Relative Humidity: 90% max
c. Barometric Pressure: 28 to 32 inches of Hg

4.2.2 Nonconforming Units. Failure of the unit to pass any examination or test of this specification shall automatically classify the unit as nonconforming. Each nonconforming unit corrected by the contractor shall be reinspected. Reinspection may be limited to the test or examination which defined the nonconformance, or, when directed by the cognizant inspector, a complete retest and reexamination may be required. Nonconforming units which have not been corrected will be considered for acceptance only upon formal application by the contractor to the cognizant NASA representative.

4.3 TESTS

4.3.1 Drawing Compliance. The assembly shall be visually examined for compliance to the requirements of Drawing 6007016. Particular attention shall be given to inspection for nicks, scratches, burrs, dents, encapsulant defects, contaminants, pin misalignment, and legibility and appearance of markings.

4.3.2 Workmanship-Vibration. For spare units only, the assembly shall be vibrated with dummy modules which simulate the respective module weight. The proper connector pins shall be wired and monitored for continuity during the vibration test. The assembly shall be mounted on the vibration fixture in a manner similar to the way it will be mounted in service so that it will be vibrated along the simulated command module X, Y, and Z axes. The assembly shall be vibrated with simple harmonic motion swept from 10 to 2000 cps at a rate of one octave/15 sec. The magnitude of vibration shall be 3.5g rms limited to a 0.3 inch pp

constant displacement from 10 cps to the crossover frequency. During vibration the continuity of the assembly shall be constantly monitored per Drawing 6014548. Any evidence of discontinuity shall be recorded and shall be cause for rejection. The monitoring circuitry shall have a response time of 10 μsec or less for any open circuit. Workmanship-vibration testing shall be performed on all units other than spares at the higher assembly level with operational modules installed.

4.3.3 Continuity and DC Resistance. Continuity and dc resistance shall be measured using a low voltage resistance measuring device in accordance with Method 303 of MIL-STD-202. Measurements shall be made from each individual pin to all other pins electrically connected, but duplicate tests of pins previously tested need not be made. All readings for pins electrically connected per Drawing 6014548 shall be less than 0.5 ohm, with the exception of those pins listed in Table I. Any readings greater than 0.5 ohm for pins electrically connected as per Drawing 6014548 shall be recorded and shall be cause for rejection. The dc resistance measured between the pins listed in Table I shall be as indicated in Table I.

4.3.4 Grounding Pin Resistance. With a dc current of 3.0±2.5 amperes passed through the frame and the pin being tested, and the dc voltage measured across the pin and the frame as shown in Figure 1, the dc resistance between each individual pin listed in Table II and the frame shall be calculated and recorded. The resistance shall be calculated using the equation specified in 6.1 and the value shall be as specified in 3.1.2. To ensure good electrical connections when measuring the voltage and current the protective finish of the frame may be penetrated.

4.3.5 Insulation Resistance. The insulation resistance between each electrically connected network and all other networks shall be as specified in 3.1.3 when measured in accordance with Method 302 of MIL-STD-202. The megohmmeter used shall have an output voltage of 500±100 vdc limited to short circuit current of 2.0 milliamperes or less. Any reading of less than 100 megohms shall be recorded and shall be cause for rejection. Spare pins shall be included as individual networks.

4.3.6 Mounting Screw Insert Resistance. With a dc current of 3.0±2.5 amperes passed through each mounting screw insert as shown in Figure 2, the dc current and voltage drop shall be measured and the mounting screw insert resistance shall be calculated using the formula specified in 6.2.a. To insure a good electrical connection to the header frame, the module guide pins may be used as a connection point. The parallel resistance of all the inserts surrounding each connector shall be calculated using the formula specified in 6.2.b and shall be equal to or less than 10 milliohms.

5. PREPARATION FOR DELIVERY

6. NOTES

6.1 GROUNDING PIN RESISTANCE EQUATION. Grounding pin resistance shall be calculated using the following equation:

$$R = \frac{E}{I} \text{ milliohms}$$

where: E is the millivoltmeter indication
I is the ammeter indication

6.2 MOUNTING SCREW INSERT RESISTANCE

a. The resistance of each mounting screw insert shall be calculated using the following formula:

$$R = \frac{E}{I}$$

where: E is the voltmeter indication
I is the ammeter indication

b. The parallel resistance of all the mounting screw inserts surrounding the connector shall be calculated using the following formula:

$$R_{Total} = \frac{1}{\frac{1}{R_1} + \frac{1}{R_2} + \cdots + \frac{1}{R_n}}$$

where: R_1, R_2, R_n are the resistance of each of the inserts surrounding the connector.

2.2 CONFLICTING REQUIREMENTS. In event of a conflict between requirements, the following order of precedence shall apply. The contractor shall also notify MIT/IL APOLLO Management of the conflict.

a. The contract
b. This specification
c. Documents listed in this section.

3. REQUIREMENTS

3.1 PERFORMANCE

3.1.1 **Continuity and DC Resistance.** Continuity shall be as specified on Drawing 6014522. All pins electrically connected except A2J19-A22 and A2J19-B22 shall exhibit dc resistance of 0.5 ohms or less. The dc resistance from A2J19-A22 to A2J19-B22 shall be 1.5K ohms to 16.0K ohms.

3.1.2 **Grounding Pin Resistance.** Each pin listed in Table I shall exhibit a dc resistance of less than 15.0 milliohms to the frame.

3.1.3 **Insulation Resistance.** The resistance between each network and all other networks shall be greater than or equal to 100 megohms. The chassis is a network.

0.3 inch pp constant displacement from 10 cps to the crossover frequency. During vibration the continuity of the assembly shall be constantly monitored per Drawing 6014522. Any evidence of discontinuity shall be recorded and shall be cause for rejection. The monitoring circuitry shall have a response time of 10 μseconds or less for any open circuit. Workmanship-vibration testing shall be performed on all units other than spares, at the higher assembly level with operational modules installed.

4.3.3 Continuity and DC Resistance. Continuity and dc resistance shall be measured using a low voltage resistance measuring device in accordance with Method 303 of Standard MIL-STD-202. Measurements shall be made from each individual pin to all other pins electrically connected, but duplicate tests of pins previously tested need not be made. All readings for pins electrically connected per Drawing 6014522 shall be less than 0.5 ohm, with the exception of pins A2J19-A22 and A2J19-B22. Any readings greater than 0.5 ohm for pins electrically connected as per drawing 6014522 shall be recorded and shall be cause for rejection. The dc resistance measured from pin A2J19-A22 to A2J19-B22 shall be 1.5K ohms to 16.0K ohms when measured with a low current resistance measuring device. This measurement shall be made passing 2.50 ma or less current through pins A2J19-A22 and A2J19-B22.

4.3.4 Grounding Pin Resistance. With a dc current of 3.0±2.5 amperes passed through the frame and the pin being tested, and the dc voltage measured across the pin and the frame as shown in Figure 1, the dc resistance between each individual pin listed in Table I and the frame shall be calculated and recorded. The resistance shall be calculated using the equation specified in 6.2 and the value shall be as specified in 3.1.2. To ensure good electrical connections when measuring the voltage and current the protective finish of the frame may be penetrated.

4.3.5 Insulation Resistance. The insulation resistance between each electrically connected network and all other networks shall be as specified in 3.1.3 when measured in accordance with Method 302 of Standard MIL-STD-202. The megohmmeter used shall have an output voltage of 500±100 vdc limited to a short circuit current of 2.0 milliamperes or less. Any reading of less than 100 megohms shall be recorded and shall be cause for rejection. Spare pins shall be included as individual networks. Megger voltage shall not be applied to the pins specified in 6.1.

4.3.6 Mounting Screw Insert Resistance. With a dc current of 3.0±2.5 amperes passed through each mounting screw insert as shown in Figure 2, the dc current and voltage drop shall be measured and the mounting screw insert resistance shall be calculated using the formula specified in 6.3a. To insure a good electrical connection to the header frame, the module guide pins may be used as a connection point. The parallel resistance of all the inserts surrounding each connector shall be calculated using the formula specified in 6.3.b and shall be equal to or less than 10 milliohms.

NOTICE – WHEN GOVERNMENT DRAWINGS, SPECIFICATIONS, OR OTHER DATA ARE USED FOR ANY PURPOSE OTHER THAN IN CONNECTION WITH A DEFINITELY RELATED GOVERNMENT PROCUREMENT OPERATION, THE UNITED STATES GOVERNMENT THEREBY INCURS NO RESPONSIBILITY NOR ANY OBLIGATION WHATSOEVER; AND THE FACT THAT THE GOVERNMENT MAY HAVE FORMULATED, FURNISHED, OR IN ANY WAY SUPPLIED THE SAID DRAWINGS, SPECIFICATIONS, OR OTHER DATA IS NOT TO BE REGARDED BY IMPLICATION OR OTHERWISE AS IN ANY MANNER LICENSING THE HOLDER OR ANY OTHER PERSON OR CORPORATION, OR CONVEYING ANY RIGHTS OR PERMISSION TO MANUFACTURE, USE, OR SELL ANY PATENTED INVENTION THAT MAY IN ANY WAY BE RELATED THERETO.

3. REQUIREMENTS

3.1 PERFORMANCE

3.1.1 Continuity and DC Resistance. Continuity shall be as specified on Drawing 6014521. All pins electrically connected except 45J19-B23 and 45J19-A23 shall exhibit dc resistance of 0.5 ohms or less. The dc resistance from 45J19-B23 to 45J19-A23 shall be 5.75k ohms ±0.85k ohms at a temperature of 22.5±2.5°C.

3.1.2 Grounding Pin Resistance. Each pin listed in Table I shall exhibit a dc resistance of 15 milliohms or less to the frame.

TABLE I

GROUNDING PINS

PIN	PIN	PIN
45J1-1	45J7-1	45J12-1
45J2-1	45J8-1	45J13-1
45J3-1	45J9-1	45J14-1
45J5-1	45J10-1	45J17-1
45J6-1	45J11-1	45J19-D9

3.1.3 Insulation Resistance. The resistance between each network and all other networks shall be greater than or equal to 100 megohms. The chassis is a network.

3.1.4 Mounting Screw Insert Resistance. The parallel resistance, from mounting screw to header frame, of all mounting screw inserts surrounding connector 45J19 shall be equal to or less than 10 milliohms.

3.2 PRODUCT CONFIGURATION

3.2.1 Drawings. The configuration of the assembly shall be in accordance with Drawing 6007103 and all drawings and engineering data referenced thereon.

4.3.2 Continuity and DC Resistance. Continuity and dc resistance shall be measured using a low voltage resistance measuring device in accordance with Method 303 of Standard MIL-STD-202. Measurements shall be made from each individual pin to all other pins electrically connected, but duplicate tests of pins previously tested need not be made. All readings for pins electrically connected per Drawing 6014521 shall be less than 0.5 ohm, with the exception of pins 45J19-B23 and 45J19-A23. Any readings greater than 0.5 ohm for pins electrically connected as per Drawing 6014521 shall be recorded and shall be cause for rejection. The dc resistance measured from pin 45J19-B23 to 45J19-A23 shall be 5.75K ohms ±0.85K ohms at a temperature of 22.5±2.5°C when measured with a low current resistance measuring device. This measurement shall be made by passing 2.50 ma or less current through pins 45J19-B23 and 45J19-A23.

4.3.3 Grounding Pin Resistance. With a dc current of 3.0±2.5 amperes passed through the frame and the pin being tested, and the dc voltage measured across the pin and the frame as shown in Figure 1, the dc resistance between each individual pin listed in Table I and the frame shall be calculated and recorded. The resistance shall be calculated using the equation specified in 6.2 and the value shall be as specified in 3.1.2. To ensure good electrical connections when measuring the voltage and current the protective finish of the frame may be penetrated..

4.3.4 Insulation Resistance. The insulation resistance between each electrically connected network and all other networks shall be as specified in 3.1.3 when measured in accordance with Method 302 of Standard MIL-STD-202. The megohmmeter used shall have an output voltage of 500±100 vdc limited to a short circuit current of 2.0 milliamperes or less. Any reading of less than 100 megohms shall be recorded and shall be cause for rejection. Spare pins shall be included as individual networks. Megger voltage shall not be applied to the pins specified in 6.1.

4.3.5 Mounting Screw Insert Resistance. With a dc current of 3.0±2.5 amperes passed through each mounting screw insert as shown in Figure 2, the dc current and voltage drop shall be measured and the mounting screw insert resistance shall be calculated using the formula specified in 6.3.a. To insure a good electrical connection to the header frame, the module guide pins may be used as a connection point. The parallel resistance of all the inserts surrounding each connector shall be calculated using the formula specified in 6.3.b and shall be equal to or less than 10 milliohms.

5. PREPARATION FOR DELIVERY

5.1 GENERAL. Preparation for delivery shall be in accordance with Specification ND1002214.

4. QUALITY ASSURANCE PROVISIONS

4.1 PRODUCT PERFORMANCE AND CONFIGURATION REQUIREMENTS/QUALITY VERIFICATION CROSS REFERENCE INDEX

Test/Examination	Requirement	Method
Continuity and DC Resistance	3.1.1	4.3.3
Grounding Pin Resistance	3.1.2	4.3.4
Insulation Resistance	3.1.3	4.3.5
Mounting Screw Insert Resistance	3.1.4	4.3.6
Drawing Compliance	3.2.1	4.3.1

4.2 GENERAL. The contractor responsible for the manufacture of the assembly shall be responsible for the accomplishment of each test required herein.

4.2.1 Test Conditions

4.2.1.1 Environmental. Unless otherwise specified, the assemblies shall be tested under the following ambient conditions:

a. Temperature: 25° ±10°C
b. Relative Humidity: 90% max
c. Barometric Pressure: 28 to 32 inches of Hg

4.2.2 Nonconforming Units. Failure of the unit to pass any examination or test of this specification shall automatically classify the unit as nonconforming. Each nonconforming unit corrected by the contractor shall be reinspected. Reinspection may be limited to the test or examination which defined the nonconformance, or, when directed by the cognizant inspector, a complete retest and reexamination may be required. Nonconforming units which have not been corrected will be considered for acceptance only upon formal application by the contractor to the cognizant NASA representative.

4.3 TESTS

4.3.1 Drawing Compliance. The assembly shall be visually examined for compliance to the requirements of Drawing 6007103. Particular attention shall be given to inspection for nicks, scratches, burrs, dents, encapsulant defects, contaminants, pin misalignment, and legibility and appearance of markings.

4.3.2 Workmanship-Vibration. For spare units only, the assembly shall be vibrated with dummy modules which simulate the respective module weight. The proper connector pins shall be wired and monitored for continuity during the vibration test. The assembly shall be mounted on the vibration fixture in a manner similar to the way it will be mounted in service so that it will be vibrated along the simulated command module X, Y, and Z axes. The assembly shall be vibrated with simple harmonic motion swept from 10 to 2000 cps at a rate of one octave/15 sec. The magnitude of vibration shall be 3.5g rms limited to a 0.3 inch pp

constant displacement from 10 cps to the crossover frequency. During vibration the continuity of the assembly shall be constantly monitored per Drawing 6014521. Any evidence of discontinuity shall be recorded and shall be cause for rejection. The monitoring circuitry shall have a response time of 10 μsec or less for any open circuit. Workmanship-vibration testing shall be performed on all units other than spares at the higher assembly level with operational modules installed.

4.3.3 Continuity and DC Resistance. Continuity and dc resistance shall be measured using a low voltage resistance measuring device in accordance with Method 303 of Standard MIL-STD-202. Measurements shall be made from each individual pin to all other pins electrically connected, but duplicate tests of pins previously tested need not be made. All readings for pins electrically connected per Drawing 6014521 shall be less than 0.5 ohm, with the exception of pins 45J19-B23 and 45J19-A23. Any readings greater than 0.5 ohm for pins electrically connected as per Drawing 6014521 shall be recorded and shall be cause for rejection. The dc resistance measured from pin 45J19-B23 to 45J19-A23 shall be 1.5K ohms to 16.0K ohms when measured with a low current resistance measuring device. This measurement shall be made by passing 2.50 ma or less current through pins 45J19-B23 and 45J19-A23.

4.3.4 Grounding Pin Resistance. With a dc current of 3.0±2.5 amperes passed through the frame and the pin being tested, and the dc voltage measured across the pin and the frame as shown in Figure 1, the dc resistance between each individual pin listed in Table I and the frame shall be calculated and recorded. The resistance shall be calculated using the equation specified in 6.2 and the value shall be as specified in 3.1.2. To ensure good electrical connections when measuring the voltage and current the protective finish of the frame may be penetrated.

4.3.5 Insulation Resistance. The insulation resistance between each electrically connected network and all other networks shall be as specified in 3.1.3 when measured in accordance with Method 302 of Standard MIL-STD-202. The megohmmeter used shall have an output voltage of 500±100 vdc limited to a short circuit current of 2.0 milliamperes or less. Any reading of less than 100 megohms shall be recorded and shall be cause for rejection. Spare pins shall be included as individual networks. Megger voltage shall not be applied to the pins specified in 6.1.

4.3.6 Mounting Screw Insert Resistance. With a dc current of 3.0±2.5 amperes passed through each mounting screw insert as shown in Figure 2, the dc current and voltage drop shall be measured and the mounting screw insert resistance shall be calculated using the formula specified in 6.3.a. To insure a good electrical connection to the header frame, the module guide pins may be used as a connection point. The parallel resistance of all the inserts surrounding each connector shall be calculated using the formula specified in 6.3.b and shall be equal to or less than 10 milliohms.

5. PREPARATION FOR DELIVERY

5.1 GENERAL. Preparation for delivery shall be in accordance with Specification ND1002214.

6. NOTES

6.1 THERMISTOR POWER DISSIPATION. It is imperative that the current utilized in measuring the dc resistance from pin 45J19-B23 to 45J19-A23 shall not exceed 2.50 ma. Any current greater than 2.50 ma will result in exceeding the resistance tolerance of the thermistor.

6.2 GROUNDING PIN RESISTANCE EQUATION. Grounding pin resistance shall be calculated using the following equation:

$$R = \frac{E}{I} \text{ milliohms}$$

where: E is the millivoltmeter indication
I is the ammeter indication

6.3 MOUNTING SCREW INSERT RESISTANCE

a. The resistance of each mounting screw insert shall be calculated using the following formula:

$$R = \frac{E}{I}$$

where: E is the voltmeter indication
I is the ammeter indication

b. The parallel resistance of all the mounting screw inserts surrounding the connector shall be calculated using the following formula:

$$R_{Total} = \frac{1}{\frac{1}{R_1} + \frac{1}{R_2} + \ldots + \frac{1}{R_n}}$$

where: R_1, R_2, R_n are the resistance of each of the inserts surrounding the connector.

(2) With the 800 pps (0° and 180°) reference inputs removed, the output between 45J19-H10 (Hi) and 45J19-K10 (Lo) shall be 28.0±1.5V rms and it shall lose synchronization.

(3) The output between 45J19-D11 (Hi) and 45J19-F11 (Lo) shall be such that a gain of 1.00±0.04 V/V is obtained by dividing the output at these pins by the output obtained in 4.3.5.b(2).

(4) The output between 45J19-G11 (Hi) and 45J19-F11 (Lo) shall be such that a gain of 1.00±0.04 V/V is obtained by dividing the output at these pins by the output obtained in 4.3.5.b(3).

c. With the dc supply voltage adjusted to 30.1±0.1 vdc, outputs shall be as specified in 4.3.5.a.

4.3.6 Power Supply, -28 VDC. With the dc supply voltage applied to 45J19-A4 (Hi) and 45J19-A5 (Lo) and with a dc test input signal applied to 45J19-G29 (Hi), 45J19-G30 (Hi), 45J19-G31 (Hi) and 45J19-G28 (Lo), the -28 VDC Power Supply tests shall be as follows:

a. With the dc supply voltage adjusted to 25.1±0.1vdc and the dc test signal adjusted to +250 mv dc minimum, the output between 45J19-F8 (Hi) and 45J19-A5 (Lo) shall be -23.0 to -31.3 vdc, and the monitor point voltage across a 10K ohm ±1 percent resistance between 45J19-F9 (Hi) and 45J19-A5 (Lo) shall be -13.5±2.1 vdc.

b. With the dc supply voltage adjusted to 30.1±0.1 vdc and the dc test signal adjusted to -250 mv dc minimum, the output between 45J19-F8 (Hi) and 45J19-A5 (Lo) shall be -23.0 to -31.3 vdc.

c. With the dc supply voltage at 30.1±0.1 vdc, the dc test signal adjusted to +250 mv dc minimum and the 25.6K pps reference input signal removed from 45J19-H23 (Hi) and 45J19-K23 (Lo), the output between 45J19-F8 (Hi) and 45J19-A5 (Lo) shall be -28 to -30 vdc.

4.3.7 ISS Turn On Detection. With a dc supply voltage of 25.1±0.1 vdc applied between 45J19-A4 (Hi) and 45J19-A5 (Lo), the following tests shall be performed. With a dc supply voltage of 30.1±0.1 vdc applied to these same pins, the following tests shall be repeated.

a. With the dc supply voltage momentarily (1 minute minimum) removed from 45J19-A4 (Hi) and then reapplied, the voltage between 45J19-G20 (Hi) and 45J19-A5 (Lo) shall be greater than +11.3 vdc, and the dc resistance between 45J19-A21 and 45J19-B21 and between 45J19-B8 and 45J19-B7 shall be less than or equal to 1.5 ohms.

b. With the dc supply voltage also applied to 45J19-H16 (Hi), the voltage between 45J19-G20 (Hi) and 45J19-A5 (Lo) shall be less than or equal to +1.5 vdc, the dc resistance between 45J19-A21 and 45J19-B21 shall be less than or equal to 1.5 ohms, and the dc resistance between 45J19-B8 and 45J19-B7 shall be greater than or equal to 5 megohms. Upon subsequent removal of the dc supply voltage from 45J19-H16 (Hi), the voltage between 45J19-G20 (Hi) and 45J19-A5 (Lo) shall remain less than or equal to +1.5 vdc, and the dc resistance between 45J19-A21 and 45J19-B21 and between 45J19-B8 and 45J19-B7 shall be greater than or equal to 5 megohms.
